ACKNOWLEDGEMENT

Newton once said "if I have seen further than others, it is by standing upon the shoulders of the giants". If I have been able to complete this thesis, it's only because there was a good team involved. I am highly grateful to the ***Almighty,*** *who is omnipresent and ever compassionate, guiding us through the life in his own ways. Without his blessings nothing can be achieved or accomplished.*

I take this opportunity to thank all those who have been helping me in the successful completion of this work.

With a deep sense of gratitude, I wish to convey my thanks to my esteemed teacher and supervisor ***Dr Naved Aslam,*** *Professor, Department of Cardiology, DMCH, Ludhiana who has supported me throughout my thesis with his patience and knowledge whilst allowing me the room to work in my own way. One simply could not wish for a better or friendlier supervisor. His able and mature guidance made the assigned task easier to accomplish. His indelible help and co-operation at all stages helped me a long way in the compilation of this project.*

I am deeply indebted and thankful to my co supervisor Dr. ***Gurpreet Singh Wander****, Head of Department, Department of Cardiology, who is a towering figure and continues to inspire us to excel in our endeavors. His truly scientist intuition has made him a constant oasis of ideas and passions in science, which exceptionally inspired and enriched my growth as a student, a researcher and a scientist. I take great pride in expressing my gratitude to him. He has always been an epitome of excellence for me and someone who has always been there for me.*

It has always been an honor to work under his awe-inspiring guidance. His never ending support and encouragement has always been the source of inspiration. He has always encouraged me to strive for perfection and stretch my limits with his exemplary leadership.

It is with great reverence that I acknowledge the valuable suggestions, scholarly guidance and constant encouragement rendered by my co-supervisor ***Dr Shibba Takkar Chhabra,*** *Associate Professor, Department of Cardiology, DMC&H, Ludhiana. An opportunity to learn from her has been one of the special things that this work provided.*

I wish to express my gratitude to ***Dr Bishav Mohan ,*** *Professor, Department of Cardiology, DMC&H, without whose valuable help this study would have been incomplete. His vital inputs, in-depth knowledge and understanding of the subject was much helpful during the study. He had always been kind enough to offer me his expert guidance whenever I was in need.*

I would also like to thank ***Dr Bhupinder Singh,*** *Associate Professor,* ***Dr Abhishek Goyal,*** *Associate Professor,* ***Dr Gurbhej singh,*** *Assistant Professor in Department of Cardiology, DMC&H for not only the academic help but also for providing me valuable opportunities while working with them.*

I am sincerely thankful to the nursing staff of the Department of Cardiology, for their never ending help and support at various stages during the study. Without their help this project would not be completed in time.

I would take this opportunity to specially thank ***Mrs Muskan Sharma, Miss Neha Bhatt, Miss Ani Madaan, Mr. Gaurav, Mr. tarun, Mr. Chamkaur*** *and other staff of the Research and Development department, DMC&H whose effort and support have been never ending. This robust task was not possible without their constant effort and enthusiasm. They have worked tirelessly for the project and helped in the compilation of the data and organizing it and later compilation of study and printing it. This study would have been incomplete without the valuable inputs of Mrs.* ***Namita Bansal,*** *who was kind enough to always help me with her expertise in statistics.*

Last but not the least; I would like to thank my family members who have helped me with this project. My family members have been a constant source of support – emotional, moral and of course financial – during my postgraduate years, and this thesis would have certainly not existed without them. Words would never be able to do justice in expressing my gratitude towards my family for being my pillar of support in my journey. I am deeply indebted to my father Mr Rakesh mohan Gupta, my mother Mrs Kusum Gupta, my in laws Dr S.C. Jelia and Mrs.Jaishree Jelia my wife Dr Upasana Mittal, my sister Prerna Mittal, for being ever so understanding and bearing with me patiently through everything. Special thanks to my lovely son Master Kiyansh mittal who has been a constant inspiration for these tireless days and without his support and cooperation this task was impossible.

Dr. ANKIT MITTAL.

INTRODUCTION

The World Health Organization (WHO) states that The enjoyment of the highest attainable standard of health is one of the fundamental rights of every human being without distinction of race, religion, political belief, economic or social condition.[1] It also states that Governments have a responsibility for the health of their peoples which can be fulfilled only by the provision of adequate health and social measures. However, without accurate health data, government may recognize important health threats too late and fail to direct adequate resources toward important causes of death or disability in its population. Without comprehensive health measurement, diseases may be underappreciated and neglected.

India is a home to 1.36 billion population of the world which represents around 17.7% percent of total world population. The progressive aging of the population, combined with increased survival of patients with cardiovascular disease as a result of therapeutic improvements, have led to a rising incidence and prevalence of heart disease placing a heavy burden on healthcare systems. Cardiovascular diseases (CVDs) is the leading cause of death worldwide as well as India.[2] . An estimated 17.3 million people died from CVDs in 2008, representing 30% of all global deaths.[3] In comparison with the people of European ancestry, CVD affects Indians at least a decade earlier and in their most productive midlife years.[4,5]

Case fatality attributable to CVD in low-income countries like India appears to be much higher than in middle- and high-income countries.[6,7] Reasons for the high propensity to develop CVD, the high case fatality, and the high premature mortality include biological mechanisms, social determinants, and their interactions. Addressing this significant burden requires an understanding of both the biological and social determinants, and the complex dynamics underlying their interaction.

Various factors influences the incidence and prevalence of cardiovascular diseases including population factors, aging population, prevalence of various risk factors like hypertension, diabetes, dyslipidemia, tobacco, alcohol, obesity etc. Seasonal variation in morbidity and mortality due to CVDs has been noted in both the northern and southern hemispheres, with higher incidence rates during the winter than in the summer. This variation linked with multiple risk factors, such as temperature, physical activity, air pollution, infections, and food habits.[8,9] Another potentially important seasonal risk factors such as seasonal variation in the plasma fibrinogen level, cholesterol, Hormones and vasoactive substance like vasopressin (AVP), nor epinephrine (NE), epinephrine (E) and angiotensin II, aldosterone and catecholamine which tends to rise in the winter is suggested to play an important role in the seasonal change of CVDs.[9]

Air pollution has now emerged as a leading problem for environmental health in the world. Especially in developing countries, it has become more serious than ever before. The potentially detrimental to health of air pollution has long been recognized, and many large epidemiological studies have clearly demonstrated the strong association between air pollution exposure and increased morbidity and mortality.[10] Air pollutants include gaseous pollutants (e.g., carbon mono oxide, oxides of nitrogen, ozone and sulfur dioxide) and particulate matters (PMs). Air Pollution increases the risk of CVD largely through particulate matter.

Particulate Matter is associated the most severe air pollution related health effects. Particulate Matter may contain toxic substances and transport them into the respiratory tract. The effect of Particulate Matter on the body can depend on its aerodynamic diameter (AD). Most PM_{10} particles have an AD range from 2.5 to 10 μm, and are deposited in the nasal cavities and bronchial airways through impaction and sedimentation, and its deposition activates innate immune response partly by endotoxin and other bacterial component. However, $PM_{2.5}$ particles with

ADs < 2.5 μm are tiny particles with various composition of noxious substance that cross the alveolar barrier and either destroy endothelial cells directly by triggering systemic hypercoagulability[11] or act through endocrine disruption causing either acute coronary syndrome, coronary artery disease and their risk factors such as hypertension, obesity and diabetes. In India, most urban location have a poor air quality index with $PM_{2.5}$ levels well above the recommended limits.

Other pollutants (gaseous) like SO_x, NO_x, CO, ozone have variable condensation reactions and multiple interactions with airborne particles. The nature of air pollution varies with time, weather, season, temperature and humidity. This variability in gaseous co-pollutants contributes to a diversity of exposures across different geographical locations and natural conditions.

The effect of season, temperature, and exposure to air pollution on cardiovascular diseases has been addressed earlier studies from other parts of the world however there is dearth of studies from Indian subcontinent region which represents almost 25% of world population. We aimed to conduct a study to understand the trend of hospitalization pattern and outcomes of cardiovascular disease with respect to seasons and environmental factors like temperature, humidity and air pollution particularly ambient air quality, $PM_{2.5}$ and PM_{10} in patients admitted in the cardiology department in a tertiary care center in North India.

AIMS AND OBJECTIVES

To study the seasonal variation in hospitalization pattern and outcomes in patients admitted at a tertiary care cardiology institute in north India.

REVIEW OF LITERATURE

Cardiovascular diseases remains a significant global health problem. Cardiovascular diseases account for one-half of all Non communicable disease [NCD] deaths in the world[12] and nearly 70% of cardiovascular disease deaths occur in low- and middle-income countries.[13] Cardiovascular diseases are the leading cause of death in every region of the world, with the exceptions of sub-Saharan Africa-where infectious diseases are still the leading cause of death-and South Korea and Japan, where cancers cause more deaths. The highest per capita cardiovascular disease burden falls upon the Eastern Europe and Central Asia regions. In South Asia, North Africa, and the Middle East, the absolute burden of cardiovascular diseases is high and more often affects young, working-age adults.[14] The swift pace of economic and social transformation in the era of industrialization and globalization presents a greater challenge for low to middle income countries. Because of aging population and improvement in case fatality rates in acute events have led to an increase in number of CVD survivors. The global burden of CVD is accelerating leading to increased morbidity, family suffering and staggering economic costs both directly as cost of diagnosis and treatment and indirectly by the loss of productivity.

Traditional risk factors responsible for global cardiovascular disease burden-dietary risks, high blood pressure, and tobacco smoking—are leading risk factors across all world regions. Certain risk factors emerge as significant causes of disease burden only in particular regions. Outdoor (ambient) and indoor air pollution are important causes of cardiovascular disease burden in East and South Asia.

Air Pollution-

Environmental pollution includes:

1. Particulate matter- PM2.5 and PM10
2. Gaseous pollutants- Sox, NOx, CO, NH3, O3, volatile organic compounds.

1. **Particulate Matter:**
   - Also called particle pollution
   - The term is used for a mixture of solid particles and liquid droplets found in the air.
   - Some particles, such as dust, dirt, soot, or smoke, are large and can be seen. Some particles are very small and cannot be seen with naked eyes

   Particle pollution includes:

   a) PM_{10}: inhalable particles, with diameters $\leq$10 micrometers.

   b) $PM_{2.5}$: fine inhalable particles, with diameters $\leq$2.5 micrometers.

   Sources of PM

   These particles come in many sizes and shapes and can be made up of hundreds of different chemicals.

   Some are emitted directly from a source, such as construction sites, unpaved roads, fields, smokestacks or fires.

   Most particles form in the atmosphere as a result of complex reactions of chemicals such as sulphur dioxide and nitrogen oxides, which are pollutants emitted from power plants, industries and automobiles.

   Effects of PM:

   Particulate matter contains microscopic solids or liquid droplets that are so small that they can be inhaled and cause serious health problems. Of these, particles less than 2.5 micrometers in diameter, also known as fine particles or $PM_{2.5}$, pose the greatest risk to health.

2. **Gaseous pollutants:**

   Other pollutants like SO_x, NO_x, CO, ozone, ammonia and volatile organic compounds have variable condensation reactions and multiple interactions with airborne particles. The nature of air pollution varies with time, weather, season, temperature and

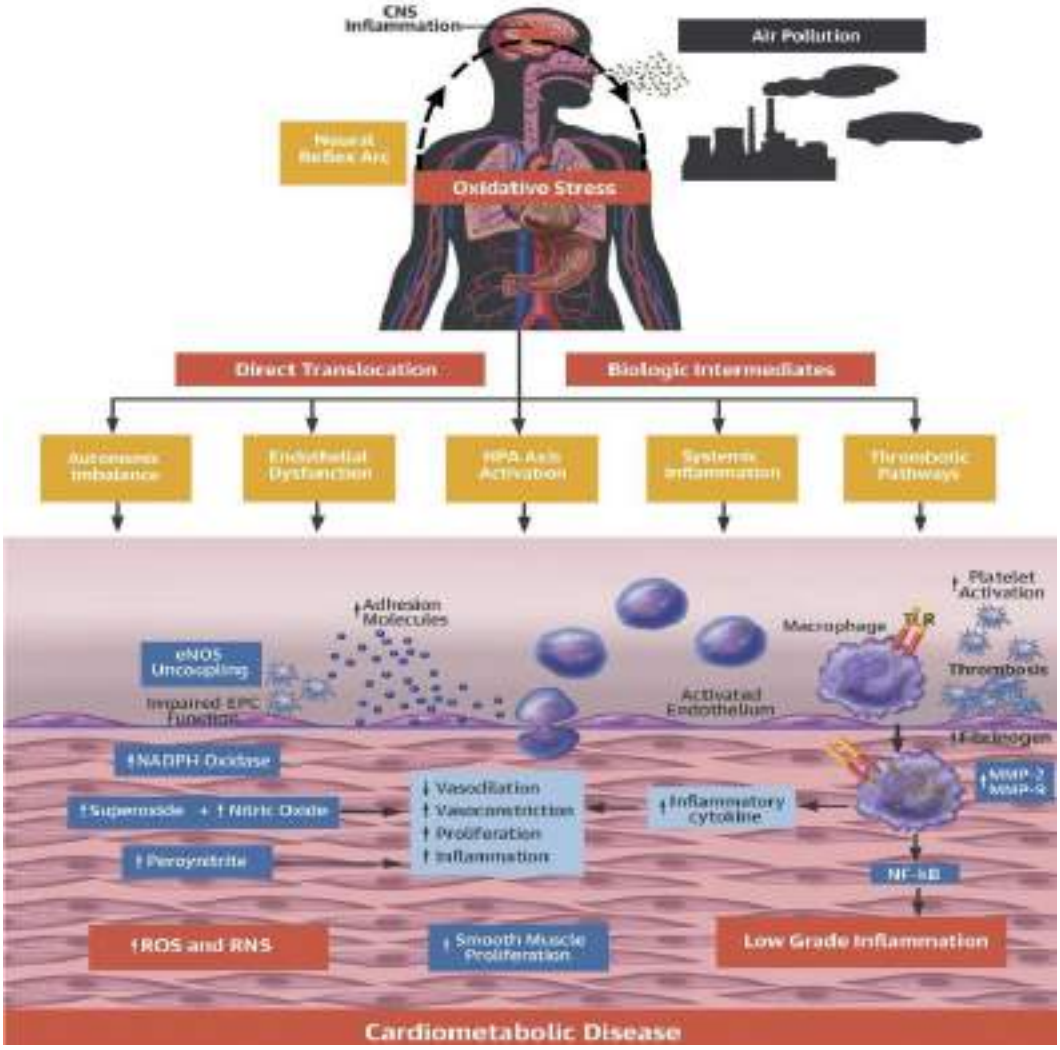
humidity. This variability in gaseous co-pollutants contributes to a diversity of exposures across different geographical locations and natural conditions.

Air pollution-Indian scenario:

Air pollution is a major planetary health risk, with India estimated to have one of the highest exposure levels to air pollution globally.[15] The major components of air pollution are particulate matter, household air pollution, and to a smaller extent ozone in the troposphere. The major sources of PM pollution are coal burning for thermal power production, industry emissions, construction activity and brick kilns, transport vehicles, road dust, residential and commercial biomass burning, waste burning, agricultural stubble burning, and diesel generators.[16]

In 2017, No state in india had annual population weighted mean PM2.5 less than the WHO recommended level of 10 μg/m³. The annual population-weighted mean exposure to ambient particulate matter PM2·5 in India was 89·9 μg/m³ in 2017. Most states, and 76·8% of the population of India, were exposed to annual population-weighted mean PM2·5 greater than 40 μg/m³, which is the limit recommended by the National Ambient Air Quality Standards in India.[17] According to the WHO database of air pollution, 14 of the 15 cities with the worst air pollution in the world are in India.[18]

Cardiovascular diseases and air pollution: pathophysiology



Pathophysiology: air pollution and cardiovascular disease.[19]

Environmental pollution is the largest cause of premature reversible death and disability in the world today.[20] A large amount of data is now available from various studies which indicates that particulate matter (PM) in air pollution is strongly associated with increased cardiovascular disease such as myocardial infarction (MI), cardiac arrhythmias, ischemic stroke, vascular dysfunction, hypertension and atherosclerosis.

Particulate Matter may contain toxic substances and transport them into the respiratory tract. The effect of PM on the body depends on its

aerodynamic diameter (AD). Most PM_{10} particles have an AD range from 2.5 to 10 μm, and are deposited in the nasal cavities and bronchial airways through impaction and sedimentation, and its deposition activates innate immune response partly by endotoxin and other bacterial component. However, $PM_{2.5}$ particles with ADs < 2.5 μm are tiny particles with various composition of noxious substance that cross the alveolar barrier and either destroy endothelial cells directly by triggering systemic hypercoagulability[11] or act through endocrine disruption causing either acute coronary syndrome, coronary artery disease and their risk factors such as hypertension, obesity and diabetes.

Air pollution and cardiovascular diseases: results of previous studies:

The positive relationship between CV mortality and PM particulates exposure has been proved in many large time series and case-crossover studies. Even a 10 μg/m3 increase in short-term (<24 h) PM2.5 level increases the relative risk (RR) of daily cardiovascular mortality by ~0.4% to 1.0%.[21] One of the largest time series study was the National Morbidity, Mortality and Air Pollution Study (NMMAPS)[22, 23]. The APHEA (Air pollution and Health: A European Approach) and APHEA-2 investigated the relationship between short-term PM exposure and CV mortality in multiple European cities[24, 25]. These studies revealed that PM particulates including the coarse particulates, PM10, were significantly associated with daily all-cause and CV mortality. Long term exposure studies conducted in USA (4-year in 204 counties) and European (10-year in five major cities) indicated that hospital admission for IHD were positively associated with increased level of fine PM particulates.[26,27]

Li et al.[28] in a Case-crossover study in eight Chinese cities found that an increase of 10 μg/m3 in 2-day moving average concentrations of PM10, SO2 and NO2, was significantly associated with increases of daily CHD mortality.

Between 1995 and 2009, the MONICA/KORA myocardial infarction registry recorded 15,417 cases of MI and coronary deaths in Germany and found an association between short-term PM's concentration and numbers of MI, especially for nonfatal and recurrent events.[29]

MCAPS[Medicare Cohort Air Pollution Study][30], a 12-year of time series study in USA suggested that daily variation in PM10 & 2.5 is associated with emergency hospitalizations for cardiovascular diseases among elderly population (≥65 years).

The mechanisms for PM exposure induced myocardial ischemic injury can be attributed to increased systemic inflammation, altered endothelial function and enhanced thrombotic tendency.[31,32]

Several studies have observed a positive association between exposure to ambient PM and the incidence of ventricular arrhythmias in patients implanted with automatic defibrillators.[33,34]

Zhao et al.[35]conducted a time-series study of 56,940 outpatient in China and concluded that a 10 μg/m3 increase in the present-day concentrations of PM10, SO2, and NO2 corresponded to increases of 0.56%, 2.07%, and 2.90% in outpatient arrhythmia visits.

Link et al in a prospective follow-up study evaluated the association of air pollution with the onset of atrial fibrillation (AF) in 176 patients with dual chamber implantable cardioverter-defibrillators (ICDs) and found that PM2.5 is an acute trigger of AF, which was associated with increased odds of AF onset within hours following exposure in patients with known cardiac disease.[36]

Raza et al.[37] in a Case-crossover study of 5,973 cases in Stockholm county from 2000-2010 revealed that short-term exposure (in 2 h) to moderate levels of O3 is associated with an increased risk of out-of-hospital cardiac arrest (OHCA)

K Bhaskaran et al in a time stratified case-crossover study linking clinical data from the Myocardial Ischaemia National Audit Project (MINAP) with PM10, ozone, CO, NO2, and SO2 data from the UK

National Air Quality Archive found that higher levels of PM10 and NO2 were associated with transiently increased risk of myocardial infarction 1-6 hours after exposure.[38]

EFFECT OF SEASON ON CARDIOVASCULAR DISEASES:

Seasonal variation in cardiovascular diseases, morbidity and mortality have been well documented in various studies across the world. Most studies have reported winter peaks in CVD-related hospitalizations and mortality; event rates in winter are significantly higher than during summer troughs.[39]

This seasonal variation in cardiovascular diseases is caused by a complex interaction between the individual's susceptibility and various environmental factors (including temperature). This seasonality is attributed to multiple physiological changes that occur during winter, such as increased sympathetic activity, alteration in the coagulation profile, endothelial dysfunction, and increased blood pressure (BP)[40,41]

Seasonal trends in various cardiovascular diseases

Heart failure

Several studies on seasonal variation in heart failure (HF) hospitalization carried out in different parts of the world[42,43] have shown an increase in admission during the winter season and a decline in summer season. Low temperature in Cold weather increases peripheral vasoconstriction which may lead to pulmonary edema as a consequence of left ventricular failure. In patients with CHF cold exposure decreases exercise capacity and increases the systemic adrenergic activation. As increased plasma nor epinephrine concentrations are associated with increased risk of death from progressive heart failure this may, in part, explain the increased mortality in winter.[44] Additionally, Increased blood pressure, lack of vitamin D; physical activity, influenza, and air pollution in winter have also been postulated as responsible factors for the higher number of cases during colder months.

Angina pectoris

Few studies exist on the seasonal variability of angina pectoris (AP). In a study of 2459 patients admitted with angina pectoris in Italy, AP has been found to correlate with a combination of critical values of low temperatures and humidity. The highest hospital admissions were during winter as compared to other seasons.[45] In Russia, the vast majority of cases of progression of angina were observed in autumn and winter.[46] In contrast, the incidence of unstable angina (UA) in Canada was found more frequent during summer than in winter.[47]

Acute myocardial infarction

An increase in mortality from acute myocardial infarction (AMI) in the winter months was first reported in the 1930s.[48] Since, these initial observations, numerous studies have reported an increased morbidity and mortality from AMI during the autumn and winter.[49,50] In contrast, a peak period of the occurrence of AMI in Hungary was found during spring.[51] Arterial blood pressure, vasoconstriction, plasma cortisol and catecholamines, platelet aggregability and numerous hematologic variables have all been shown to display a seasonal rhythm. Potential environmental and lifestyle factors associated with precipitation of AMI include physical exertion and outdoor temperature.

Sudden cardiac death

Seasonal variation in sudden cardiac death (SCD) has been well documented by several epidemiological studies with maximum and minimum incidences in winter and summer.[52] While, few studies, observed a different seasonal peak in the onset of SCD characterized by a higher frequency in the summer months.[53] The exact cause of this variation is unknown, but it is believed that a combination of external and internal factors such as cold weather, increased platelet aggregability, decreased fibrinolytic activity, and other blood components involved in thrombogenesis may be an important risk factor in bringing on the onset of SCD in winter.[54]

Atrial fibrillation

Seasonal variation in the occurrence of atrial fibrillation has been documented, with peaks typically occurring in the winter-autumn and troughs in the summer, the mechanisms and factors underlying this phenomenon remain unclear. The extensive Danish population studies carried out for fourteen years and involving approximately 33,000 patients with atrial fibrillation (AF) paroxysms reported an inversely proportional influence of mean outdoor temperature and similar effect of season.[55] Studies performed in Japan showed maximum AF incidence in autumn, with a significant reduction in summer.[56]

Ventricular arrhythmias

The seasonal variation of ventricular arrhythmias (VA) has been assessed in studies with animal models and observational studies. In a study of 154 patients with ischemic heart disease (IHD), the incidence of ventricular tachycardia (VT) or ventricular fibrillation (VF) episodes was found to be higher in winter months and the lowest in summer, spring, and fall.[57] The potential factors that can influence the seasonal variation of VA have not been fully understood. Wide variation in temperature can trigger alterations in physiological processes determining a seasonal variation in cardiovascular events. In contrast, the incidence of VA in southern Brazil and Japan was found more frequent during summer than in winter months.[58]

Deep venous thrombosis

A number of studies have focused specifically on the seasonal variability of deep venous thrombosis (DVT). Most studies have reported a higher occurrence of DVT during the winter months.[59] Only a few studies have failed to find such seasonal variation in the incidence of DVT. Futhermore, reduced physical activity during the winter months, reduce blood flow in the lower limbs and decreased fibrinolytic activity have been suggested to be associated with the increase incidence of DVT in winter.

Pulmonary embolism

Seasonal variation in pulmonary embolism has been well documented by several epidemiological studies with maximum and minimum incidences in winter and summer.[60] While, few studies, observed a different seasonal peak in the onset of acute pulmonary embolism characterized by a higher frequency in the autumn and spring, and others found no significant differences in seasonal distribution of pulmonary embolism episodes. The seasonal increases in pulmonary embolism episodes have been explained by the changes in coagulation factors level, peripheral vasoconstriction and reduced activity.

MATERIAL AND METHODS

Study was be conducted over a period of 1 year at Hero DMC heart institute, Ludhiana, Punjab, India. It is a tertiary care medical college and Hospital.

For the data about the various cardiovascular diseases admission pattern and outcomes the file records of each and every patient admitted in cardiology unit at Hero DMC heart institute, Ludhiana during 1 year study period and 1 year prior to that. The data was collected regarding the baseline characteristics of the patient like, Name, age, Gender, Address, date of admission, date of discharge. Duration of stay and duration of critical area stay was calculated from the file records. Outcomes were noted as patient being discharged as a positive outcome and mortality as poor outcome. Number of patients who were discharged prematurely against medical advice were also noted. Data was collected regarding primary cardiovascular diagnosis as well as associated morbidities like diabetes, hypertension, anaemia, CKD, prior coronary artery disease, prior cardiomyopathy, chest infections etc. Data regarding the blood investigations, ejection fraction, cardiac enzymes was also recorded.

Patients who were brought to emergency after sudden cardiac arrest and could not be revived was also recorded to asses for sudden cardiac death.

Data was recorded and segregated on monthly basis as well as seasons. Patients from rural vs urban background were also segregated for further analysis.

INCLUSION CRITERIA:

All the patients admitted at Hero DMC Heart institute. In cardiology department from 1st April 2017 to 31st March 2019.

EXCLUSION CRITERIA:

Only the patients admitted in cardiology department at Hero DMC heart Institute were recruited. Patients admitted under other departments

including internal medicine and cardiothoracic surgery were not included in this study.

Metereological Data was regarding the temperature, humidity, air pollution-PM & gaseous pollutants was collected from website of central pollution control board derived from Punjab Agricultural University, Ludhiana. Data for weather was collected from Punjab Agricultural University, Ludhiana. Data was collected on a daily basis and was used for correlation with admitting diagnosis. Air Quality sub index was recorded for each pollutant and air quality index was derived. To assess for immediate effect of pollutants peak and average value of each sub index was noted as per the date of admission. As there may be a lag period in the exposure and clinical manifestation of a disease a 7 day average prior to date of admission was also noted.

STATISTICAL ANALYSIS

After the data has been collected, it was subjected to statistical analysis after examining for distribution and homogeneity of variance to select appropriate (parametric/nonparametric) statistical tests. The data were presented as mean ± standard deviation (SD). Frequency distribution tables were made for the number of admissions in each month. Data for each month was first analysed separately and then data was clubbed for both years based on months.

Correlations were calculated using Pearson correlation. Statistical significance was used at conventional 5% ($p<0.05$). Strength of correlation was assessed as weak, modest, strong for ‘r’ values being < 0.3, 0.3 to 0.7, > 0.7 respectively. Correlations were derived on daily bases that is number of admissions and mean durations were correlated with pollution/weather data of that particular day. 7 days average was also used for pollution and environmental data. Monthly correlations were calculated after segregating data on monthly bases using Pearson correlation.

RESULTS AND OBSERVATION

This was an observational cross sectional study. All the variable are presented as mean ± standard deviation. Records of all the patients admitted in cardiology unit at a tertiary care center in Ludhiana, Punjab, India during 2 years period i.e. 1st April 2017 to 31st March 2019 were analyzed. Records of the patients who were brought to emergency after sudden cardiac death were also analyzed. A total of 15757 patients were admitted during this period, 1105 expired, 13756 were discharged after improvement and 896 were discharged against medical advice. 361 patients were brought after sudden cardiac death.

Baseline characteristics:

Table 1: Gender distribution.

GENDER	No. of cases	Percentage (n=15757)
Female[F]	5767	36.6%
Male[M]	9990	63.4%

A total of 15757 were admitted during the study period. Mean age was 61.4 + 13.4 years. Total number of males were 9990 and females were 5767 constituting 63.4% and 36.6% respectively.

Mean duration of hospital stay was 6.4 $\pm$ 5 days with stay in critical area being 3.8 $\pm$ 4 days.

Monthly Distribution of admissions:

Total number of admitted patients were segregated on monthly basis. In first year of study a total of 7604 patients were admitted. Maximum number of admissions were in November, December, January and February in first year which constituted 38.9% of total admissions in the year.

As expected months with lowest temperature were November to March with January being the coldest in each year. Most humid months were monsoon i.e. from July to September. Pollution parameters varied over the year with no specific pattern.

Correlation of meteorological Data and pollution with outcome parameters:

Pollution data was collected for each day and then parameters were sub indexed for air quality. Correlations were calculated using pearson correlation for each outcome variable including no of admission during a day and outcomes of such patients based on duration of stay, duration of critical area stay, mortality.

A) Pollution parameters [AQI, PM2.5, PM10] with outcomes:

Statistically Significant correlation was seen between number of admissions & AQI, air quality index averaged over 7 days, Mean PM2.5, Max PM2.5, Mean PM2.5 averaged over 7 days, PM10 Mean, Max and 7 days average of PM10. Correlations were weak positive but statistically significant. No significant correlation found with duration of hospital stay. Statistically significant weak negative correlation was there for duration of critical care stay. No significant correlation was there for mortality with these parameters

B) Weather parameters [Temp. and humidity] with outcomes:

Maximum Temperature, Minimum temperature, and 7 days average of these values showed statistically significant moderate negative correlation with number of admissions as outcome parameter. Duration of stay had statistically significant weakly negative correlation with above parameters. Duration of critical care stay had no significant correlation. Mortality had weak negative statistically significantly correlated with temperature (min, max, 7 day average)

Humidity (both mean and 7 day average) had statistically significant weak positive correlation with number of admissions and duration of critical area stay. No significant correlation was there with duration of stay and mortality.

ACUTE CORONARY SYNDROME [ACS]:

Out of 5763 patients of acute coronary syndrome, 526 expired, 4839 improved and discharged whereas premature discharge against medical advice were 398 patients.

Month with maximum admission due to ACS were January 2019, December 2018 and February 2019. In terms of mortality maximum mortality was seen in January 2018 where 48 patients expired in the

month amongst patients of ACS. Other months with more than 30 mortality in a month related to ACS were November 2017, December 2017, November 2018 and January 2019.

Temperature, both minimum and maximum as well as 7 day average had moderate negative correlation with number of admissions which was statistically significant. Humidity had statistically significant weak positive correlations with number of admissions.

None of these parameters had any significant correlation with the duration of stay per patient or duration of critical area stay per patient.

OTHER CARDIOVASCULAR DISEASES & SEASONAL TREND:

Other cardiovascular diseases like Stable Angina, Valvular Heart Disease, Congenital Heart Disease, Infective Endocarditis, Cerebrovascular Accidents, Complete Heart Block, DVT, Pulmonary Embolism, ventricular and atrial arrhythmias had some months with peak incidence but did not follow any particular trend during frequency distribution analysis. Also the number of cases were also less so correlation on daily basis was not applied.

When data was segregated on monthly basis and correlations were derived a statistically significant correlation was found between temperature and number of admissions. It was a strong Negative correlation. Moderate positive correlation was found between humidity and duration of ICU stay. A moderate negative correlation was present between AQI, PM2.5, and PM10 levels and duration of ICU stay. Other correlations were not significant.

On evaluation of data a no correlation was there between number of admissions and temperature. A moderate negative correlation was found in duration of stay in ICU with AQI, PM2.5 and PM10. No other correlations were found.

DISCUSSION

In the present study, records of all patients admitted at Hero DMC heart institute, Ludhiana in cardiology department over the period of April 2017 to March 2019 were analyzed. During this period a total of 15757 patients were admitted in cardiology department. Mean age was 61.4 ± 13.4 years. There was a gender bias, 63.4% patients were males. Around 53% patients were from Ludhiana where others were referred from outside Ludhiana including 4.3% patients from states other than Punjab. 76.6% patients were from urban areas and rural population constituted only 23.4% patients. 69.3% of all admissions were from emergency department representing relatively sicker patients and others from outpatient department. Prior history coronary artery disease was present in more than two-third of the patients whereas diabetics constituted one third of the study population. Around half of the patients were hypertensive. Whereas prior cardiomyopathy and Chronic kidney disease was there in 15% and 10% patients respectively.

Of all patients admitted during this period [15757 patients], 1105 expired, 13756 were discharged after improvement and 896 were discharged against medical advice. 361 patients were brought after sudden cardiac death. Mean duration of stay per patient was 6.4 days. Whereas mean duration of stay in critical areas [ICU, Emergency] was 3.8 days.

Maximum number of admissions were there during winter months that is November to February with maximum numbers during the January when the temperature was the lowest. About 38% of total admissions are during these 4 months. This indicate a clear trend towards increased admission rates in winter months as compared to other months which was in accordance to previous studies showing winter rise.[39]

Mortality also followed the seasonal trend and was highest during the winter months. November to February, these 4 months constituted about 45% of all mortality. Patient brought after cardiac arrest were

highest in December month in both 2017 & 2018. Other months however did not have any particular trend.

For assessment of correlation between pollution with hospitalizations, pollution data was collected for each day and then parameters were sub indexed for air quality. Parameter with the worst sub index for the day was used as air quality index as per guidelines from central pollution control board. Correlations were calculated using pearson correlation for each outcome variable including no of admission during a day and outcomes of such patients based on duration of stay, duration of critical area stay, mortality. For the duration of stay & duration of critical area stay total duration of all admission was calculated and then divided by the number of admissions for that day so as to give mean duration independent of number of admissions.

Weak positive correlation was seen between pollution parameters and number of admissions. Correlations were weak positive but statistically significant indicating a statistically significant trend of increased admission rates with rise of pollution levels but this relationship is not linear and multifactorial which needs further validation. No significant correlation found with duration of hospital stay which indicates no relationship of pollution with the total hospital stay.

Statistically significant weak negative correlation was there for duration of critical care stay. Our institute being one of the high volume centers with almost full ICUs round the year so a rise in number of admissions to critical areas leads to triage leading to earlier transfer to the monitored wards. So this weak negative correlation of duration of critical area stay reflects this rapid turnover with worsening of pollution. No significant correlation was there for mortality with pollution parameters.

Weather parameters (Maximum Temperature, Minimum temperature, and 7 days average) showed statistically significant moderate negative correlation with number of admissions as outcome parameter indicating a good negative relationship which means that with

the fall in temperature number of admissions were increased and this relationship was moderate. Duration of stay had statistically significant weak negative correlation with above parameters. But this correlation was very weak not indicating any trends. Duration of critical care stay had no significant correlation with temperature. Mortality had weakly negative statistically significantly correlated with temperature (min, max, 7 day average). Humidity (both mean and 7 day average) had statistically significant weak positive correlation with number of admissions and duration of critical area stay. No significant correlation was there with duration of stay and mortality.

When data was arranged on monthly bases and correlations were derived, a strong a statistically significant correlation was found between temperature and number of admissions. It was a strong Negative correlation indicating almost a linear relationship between temperature fall and number of admissions. Moderate positive correlation was found between humidity and duration of ICU stay. A moderate negative correlation was present between AQI, PM2.5, and PM10 levels and duration of ICU stay. Other correlations were not significant.

When data was segregated according to the disease it showed a clear trend in some of the cardiovascular diseases whereas other disease did not follow any particular trend. Diseases which showed a clear trend were Anemia, Heart failure including both reduced ejection fraction (HFrEF) as well as preserved ejection fraction (HFpEF), HFnEF, HFpEF, Acute coronary syndrome (ACS), ST Elevation MI and Acute Kidney injury which is an important comorbid condition in many of the cardiovascular disease.

ACUTE CORONARY SYNDROME

Acute Coronary Syndrome (ACS) showed a clear winter predominance with more than 40% of all admissions during the 4 months between November and February. During the winters number of deaths were high during the same months constituting 46% of total mortality.

On correlating with pollution and weather parameters, a statistically significant correlation was seen for number of admissions with PM2.5 maximum value and maximum 7 day average and PM10 values averaged over 7 days. All were weak positive correlations indicating a significant trend but not linear and needs further validation. Other pollution parameters and outcome parameters did not show any significant correlation.

Temperature, both minimum and maximum as well as 7 day average had moderate negative correlation with number of admissions which was statistically significant indicating a moderate relationship between temperature and incidence of Acute Coronary Syndrome. Humidity had weak positive correlations with number of admissions indicating a relationship which is significant, positive but not linear. None of these parameters had any significant correlation with duration of stay per patient or duration of critical area stay per patient.

When data was evaluated on monthly bases for acute coronary syndrome, a strong negative correlation was there between number of admissions and temperature indicating an almost linear statistically significant correlation. A moderate negative correlation was found in duration of stay in ICU with AQI, PM2.5 and PM10 indicating a higher number of patients requiring ICU care during worsening of pollution leading to significant decrease in duration of ICU stay.

HEART FAILURE

Out of 4561 patients of acute decompensated heart failure, 14% expired, 78% improved and discharged whereas premature discharge against medical advice were 8% patients.

Month with maximum admission due to acute decompensated heart failure were January 2019, and February 2019 followed by December 2018, January 2018 and December 2017. In terms of mortality maximum mortality was seen between November 2017 and February 2018 followed by January and February 2019. Winter months that is November to

February had 45% of total admissions due to heart failure with mortality constituting 47% of all mortality due to heart failure.

On correlating pollution factors with outcome parameters statistically significant correlation was seen for number of admissions with PM2.5 maximum, mean and 7 day average and PM10 maximum, mean and 7 day average values. All were weak positive correlations showing a significant trend but relationship is not linear and multifactorial.

Temperature, both minimum and maximum as well as 7 day average had moderate negative correlation with number of admissions which was statistically significant indicating a significant trend of increasing admission with decreasing temperature. Humidity had statistically significant weak positive correlations with number of admissions. None of these parameters had any significant correlation with the duration of stay per patient or duration of critical area stay per patient.

On evaluation of data on monthly bases a strong negative correlation was there between number of admissions and temperature indicating a significant trend. A moderate negative correlation was found in duration of stay in ICU with AQI, PM2.5 and PM10. No other correlations were found.

ST ELEVATION MYOCARDIAL INFARCTION

Out of 5763 patients of acute coronary syndrome, 2202 patients presented with ST elevation MI. 9% patients expired, 84% improved and discharged whereas premature discharge against medical advice were 6%. Months with maximum admission due to STEMI were November 2018 and December 2018 followed by January 2019 and February 2019 i.e. winter months. However when Data for both years was combined maximum STEMI were in months of November to February constituting around 38% cases whereas these 4 months alone had more than 50% mortality.

On correlating environmental factors with outcome parameters no statistically significant correlation was seen for number of admissions, duration of stay per patient or duration of critical area stay per patient with

AQI, PM2.5 and PM10.

Temperature, both minimum and maximum as well as 7 day average had weak negative correlation with number of admissions which was statistically significant. Humidity had no significant correlation.

On correlating data on monthly bases a moderate negative correlation was found in duration of stay in ICU with AQI, PM2.5 and PM10. No significant correlations were found between environmental factors and number of admissions, duration of stay.

OTHER CARDIOVASCULAR DISEASE

Other cardiovascular diseases like Stable Angina, Valvular Heart Disease, Congenital Heart Disease, Infective Endocarditis, Cerebrovascular Accidents, Complete Heart Block, DVT, Pulmonary Embolism, ventricular and atrial arrhythmias had some months with peak incidence but did not follow any particular trend during frequency distribution analysis. Also the number of cases were also less so correlation on daily basis was not applied.

STRENGTH AND LIMITATIONS

There is a dearth of large studies from India on effects of pollution and season on cardiovascular disease. This is the first study of its kind from the northern part of India. Study area is in northern part of India which has many seasons and have temperature as low as 3-4^{0}C in winters to as high as 48^{0}C in summers. This wide variation in temperature allows for study of seasonality in a better way. Indian cities are one of the most polluted cities thus study in this population reflects a unique model to understand both seasonality and effect on pollution at same time. Also the study population was large so a good inferences can be drawn. Also study was conducted over 2 year period so that effect of other temporary variables eg. viral epidemics can be negated.

Though study was sufficiently powered but its limitations cannot be ignored. It was an observational study based on hospital records. Causal relationship cannot be established by such study design and further

studies are needed. Study population represented a small geographical location which needs further studies to extrapolate data to other geographical areas.

SUMMARY AND CONCLUSION

India is a home to 17.7% of world's population, second only after China. Cardiovascular diseases are the leading cause of mortality all over the world as well as India. There has been seasonal trends in cardiovascular diseases as shown in previous studies. Also pollution parameters have been shown to correlate with the incidence of cardiovascular diseases. Present study was aimed to study this trend in a tertiary care center in Ludhiana, Punjab, India. The study center belongs to northern part of India which has wide variability in seasons with all 4 seasons. Temperature ranges to as low as 3^0C and as high as 48^0C in this region. This allowed for an optimal room for this study.

Seasonal trends were noted in overall hospitalization pattern in the hospital with maximum number of admissions in the winter months that is November to February which constitutes 38% of all admissions. Mortality was also high during these months constituting about 45% of all mortality per year. Other outcome parameters that is duration of stay and duration of ICU stay did vary between the months but did not follow any specific seasonal pattern.

Weak positive correlation was seen between pollution parameters and number of admissions indicating a statistically significant trend of increased admission rates with rise of pollution levels but this relationship is not linear and multifactorial which needs further validation.

Temperature had moderate negative correlation with number of admissions indicating a good negative relationship which means that with the fall in temperature number of admissions were increased and this relationship was moderate. Humidity had weak positive correlation with number of admissions and duration of critical area stay.

When data was arranged on monthly bases and correlations were derived, a strong negative correlation was found between temperature and number of admissions. A moderate negative correlation was present between AQI, PM2.5, and PM10 levels and duration of ICU stay. Other

correlations were not significant.

When data was segregated according to the disease it showed a clear trend in some of the cardiovascular diseases whereas other disease did not follow any particular trend. Diseases which showed a clear trend were Anemia, Heart failure including both reduced ejection fraction (HFrEF) as well as preserved ejection fraction (HFpEF), HFnEF, HFpEF, Acute coronary syndrome (ACS), ST Elevation MI and Acute Kidney injury which is an important comorbid condition in many of the cardiovascular disease.

Weak positive correlation was seen between number of admission and some of the pollution parameters amongst the patients with acute coronary syndrome. Temperature had a moderate negative correlation with number of admissions in ACS whereas humidity had a weak positive correlation.

A strong negative correlation was there between temperature and number of admissions in patients of ACS when data was segregated on a monthly bases indicating almost a linear relationship between temperature and number of admissions in a month in patients of ACS.

Heart failure had higher incidence and mortality in winter months. Correlation of pollution parameters and number of admissions was weak positive with some parameters. Temperature and number of admissions had a moderate negative correlation in this population.

On evaluation of data on monthly bases a strong negative correlation was there between number of admissions and temperature indicating a significant trend. A moderate negative correlation was found in duration of stay in ICU with AQI, PM2.5 and PM10. No other correlations were found.

CONCLUSION:

Cardiovascular diseases shows a seasonal trend in overall admission patterns with maximum admission is winter months. A significant correlation was seen between number of admissions and

temperature. This trend was also seen on individual disease assessment in case of Anemia, ACS, STEMI, Heart Failure, HFnEF and HFrEF.

Pollution and humidity had weak correlations with number of admissions and necessitates evaluation in further studies.

INTRODUCTION: There is a seasonal trend of cardiovascular diseases, with the highest incidence occurring during the colder/winter months, described in many countries. This contributes to the numbers of deaths occurring in winters. Understanding the influence of season and other factors is essential when seeking to implement effective public health measures.

This study will be conducted to determine the seasonal trends of admission patterns and outcomes in a tertiary care cardiology unit.

AIM: To determine seasonal trends of admission patterns and outcomes in a tertiary care cardiology unit

MATERIALS AND METHODS: Study will be conducted over a period of 1 year. Data will be collected retrospectively for previous 1 year and anterospectively for a period of 1 year from the records available at hero DMC heart institute. Data will be segregated & analysed for cardiac diagnosis, co morbidities and outcomes in the form of Discharge/DAMA/Death. Meteorological data will be collected during this period and will be analysed and correlated with the admission trends and outcomes.

CLINICAL SIGNIFICANCE: Seasonal variation in cardiovascular disease is well known but there is no reliable data available regarding the same in this part of the world. Clearly, emigration is not an option However, a number of simple precautions to reduce the risk of CVD could be taken. These includes adequate indoor heating, wearing protective clothing, especially outdoor protection of the face, and avoiding unaccustomed strenuous exercise.

KEYWORDS: Heart failure, HT, Myocardial Infarction, CAD

6.0 BRIEF RESUME OF THE INTENDED WORK

6.1 NEED FOR THE STUDY

The progressive aging of the population, combined with increased survival of patients with cardiovascular disease as a result of therapeutic improvements, have led to an escalating incidence and prevalence of heart disease placing a heavy burden on healthcare systems. Cardiovascular diseases (CVDs) is the number one cause of death worldwide. An estimated 17.3 million people died from CVDs in 2008, representing 30% of all global deaths.[1] Seasonal variation in morbidity and mortality due to Cardiovascular diseases has been noted in both the northern and southern hemispheres, with higher incidence rates during the winter than in the summer. Cardiovascular diseases including hypertension, heart failure, angina pectoris, acute myocardial infaction, atrial fibrillation, ventricular arrhythmias, deep venous thrombosis, pulmonary embolism, aortic dissection, sudden cardiac death have all shown a significant seasonal pattern. This variation linked with multiple risk factors, such as temperature, physical activity, air pollution, infections, and food habits.[2,3] Another potentially important seasonal risk factors such as seasonal variation in the plasma level of fibrinogen, cholesterol, Hormones and vasoactive substance including vasopressin (AVP), nor epinephrine (NE), epinephrine (E) and angiotensin II, aldosterone and catecholamine which tends to rise in the winter is suggested to play an important role in the seasonal change of Cardiovascular diseases.[3] However, the influence of these factors on the onset and course of cardiovascular events is not well understood.

Seasonal variation in cardiovascular disease is well known but there is no reliable data available regarding the same in this part of the world. Clearly, emigration is not an option However, a number of simple precautions to reduce the risk of CVD could be taken. These includes adequate indoor heating, wearing protective clothing, especially outdoor protection of the face, and avoiding unaccustomed strenuous exercise

This study will be conducted to study seasonal variation in hospitalization pattern and outcomes in patients admitted at a tertiary care centre in north India.

6.2 REVIEW OF LITERATURE

Cardiovascular diseases includes a spectrum like hypertension, heart failure, angina pectoris, acute myocardial infaction, atrial fibrillation, ventricular arrhythmias, deep venous thrombosis, pulmonary embolism, aortic dissection, sudden cardiac death. The seasonal variation as per the available literature is a as follows:

Hypertension

Seasonal influence on arterial blood pressure has been demonstrated by various studies based on single or repeated measurements among adults, the elderly, and children as well as healthy and hypertensive subjects. [4] Both systolic and diastolic mean blood pressures have shown a seasonal peak during winter and trough in summer. The seasonal variation in hypertension is likely to reflect seasonal variations in one or more risk factors. The risk factors proposed by investigators have included: Outdoor temperature, physical activity, seasonality of vitamin D, seasonal variation in serum cholesterol level, noradrenalin, catecholamine, and vasopressin.

Heart failure

Several studies on seasonal variation in heart failure (HF) hospitalization carried out in different parts of the world[5,6] have shown an increase in admission during the winter season and a decline in summer season. Cold weather, among other factors, increases peripheral vasoconstriction, which may lead to pulmonary edema as a consequence of left ventricular failure. In patients with symptomatic CHF, cold exposure decreases exercise capacity and increases the already raised systemic adrenergic activation. As increased plasma nor epinephrine concentrations are associated with increased risk of

death from progressive heart failure this may, in part, explain the increased mortality in winter.[7] Additionally, Increased blood pressure, lack of vitamin D; physical activity, influenza, and air pollution in winter have also been postulated as responsible factors for the higher number of cases during colder months.

Angina pectoris

Few studies exist on the seasonal variability of angina pectoris (AP). In a study of 2459 patients admitted with angina pectoris in Italy, AP has been found to correlate with a combination of critical values of low temperatures and humidity. The highest hospital admissions were during winter as compared to other seasons.[8] In Russia, the vast majority of cases of progression of angina were observed in autumn and winter.[9] In contrast, the incidence of unstable angina (UA) in Canada was found more frequent during summer than in winter.[10]

Acute myocardial infarction

An increase in mortality from acute myocardial infarction (AMI) in the winter months was first reported in the 1930s.[11] Since, these initial observations, numerous studies have reported an increased morbidity and mortality from AMI during the autumn and winter.[12,13] In contrast, a peak period of the occurrence of AMI in Hungary was found during spring.[14] Arterial blood pressure, vasoconstriction, plasma cortisol and catecholamines, platelet aggregability and numerous hematologic variables have all been shown to display a seasonal rhythm. Potential environmental and lifestyle factors associated with precipitation of AMI include physical exertion and outdoor temperature.

Sudden cardiac death

Seasonal variation in sudden cardiac death (SCD) has been well documented by several epidemiological studies with maximum and minimum incidences in winter and summer.[15] While, few studies, observed a different seasonal peak in the onset of SCD characterized by a higher frequency in the summer months.[16] The exact cause of this variation is unknown, but it is believed that a combination of external and internal factors such as cold weather, increased platelet aggregability, decreased fibrinolytic activity, and other blood components involved in thrombogenesis may be an important risk factor in bringing on the onset of SCD in winter.[17]

Atrial fibrillation

Seasonal variation in the occurrence of atrial fibrillation has been documented, with peaks typically occurring in the winter-autumn and troughs in the summer, the mechanisms and factors underlying this phenomenon remain unclear. The extensive Danish population studies carried out for fourteen years and involving approximately 33,000 patients with atrial fibrillation (AF) paroxysms reported an inversely proportional influence of mean outdoor temperature and similar effect of season.[18] Studies performed in Japan showed maximum AF incidence in autumn, with a significant reduction in summer.[19]

Ventricular arrhythmias

The seasonal variation of ventricular arrhythmias (VA) has been assessed in studies with animal models and observational studies. In a study of 154 patients with ischemic heart disease (IHD), the incidence of ventricular tachycardia (VT) or ventricular fibrillation (VF) episodes was found to be

higher in winter months and the lowest in summer, spring, and fall.[20] The potential factors that can influence the seasonal variation of VA have not been fully understood. Thermal stress, due to very low as well as very high temperatures, can trigger alterations in physiological processes and may be pathophysiological ones, determining a seasonal variation in cardiovascular events. In contrast, the incidence of VA in southern Brazil and Japan was found more frequent during summer than in winter months.[21]

Deep venous thrombosis

A number of studies have focused specifically on the seasonal variability of deep venous thrombosis (DVT). Most studies have reported a higher occurrence of DVT during the winter months.[22] Only a few studies have failed to find such seasonal variation in the incidence of DVT. Futhermore, reduced physical activity during the winter months, reduce blood flow in the lower limbs and decreased fibrinolytic activity have been suggested to be associated with the increase incidence of DVT in winter.

Pulmonary embolism

Seasonal variation in pulmonary embolism has been well documented by several epidemiological studies with maximum and minimum incidences in winter and summer.[23] While, few studies, observed a different seasonal peak in the onset of acute pulmonary embolism characterized by a higher frequency in the autumn and spring, and others found no significant differences in seasonal distribution of pulmonary embolism episodes. The seasonal increases in pulmonary embolism episodes have been explained by the changes in coagulation factors level, peripheral vasoconstriction and reduced activity.

Aortic rupture/dissection

Several studies have reported a seasonal variation in the incidence of in aortic rupture or dissection, the incidence of aortic dissection and rupture were found to be higher in winter time than in summer.[24] Many of these studies reported significant peak of incidence in spring and autumn while only a few failed to find convincing evidence of seasonality in rupture or dissection of aortic aneurysm.[25,26] The underlying cause is unknown. Winter is also characterized by pro-thrombotic state. Fibrinogen levels demonstrate wide seasonal variation, increasing up to 23% during the colder months. Also incidence hypertension increases during colder months. Other not well understood factors may also contribute to this increased incidence.

The data from north india is lacking regarding the same.

6.3 AIMS AND OBJECTIVES

To study the seasonal trends of admission patterns and outcomes in tertiary care cardiology unit.

7. MATERIAL AND METHODS

Study will be conducted over a period of 1 year. Data will be collected retrospectively for previous 1 year & prospectively for a period of 1 year from the records available at hero DMC heart institute. Data will be collected regarding the diagnosis , comorbidities, procedures, duration of hospital stay, duration of ICU/emergency stay, previous admissions. Data will be segregated on monthly basis and will be correlated with the meteorological data at the time of admission.

7.1 SOURCE OF DATA

Data collection will be done by analysing the file record available at record section at Hero DMC heart institute, Ludhiana. Data will be collected and segregated on monthly basis. Data will be analysed for cardiac diagnosis, co morbidities and outcomes in the form of Discharge/DAMA/Death. Meteorological data regarding air pollution, temperature, humidity and other parameters will be collected on monthly basis regarding the previous year and and the coming year from the meteorological data available at our centre.

7.2 STATISTICAL ANALYSIS

After the data has been collected, it will be subjected to analysis using appropriate statistical methods. The data obtained at various stages of the study will be compared and a possible correlation shall be attempted to establish the relationship between the various parameters studied, taking into account the specific objectives of the study as well as type of the data.

7.3 DOES THE STUDY REQUIRE ANY INVESTIGATIONS OR INTERVENTIONS TO BE CONDUCTED ON PATIENTS OR OTHER HUMANS OR ANIMALS? IF SO, PLEASE DESCRIBE BRIEFLY

No

7.4 HAS ETHICAL CLEARANCE BEEN OBTAINED FROM YOUR INSTITUTION IN CASE OF 7.3?
